

STATISTICS WORKSHEET-3

Q1 to Q9 have only one correct answer. Choose the correct option to answer your question.

 Which of the following is the correct formula 	for total variation?
---	----------------------

- a) Total Variation = Residual Variation Regression Variation
- b) Total Variation = Residual Variation + Regression Variation
- c) Total Variation = Residual Variation * Regression Variation
 - d) All of the mentioned

b)

- 2. Collection of exchangeable binary outcomes for the same covariate data are called outcomes.
 - a) random
 - b) direct
 - c) binomial
 - d) none of the mentioned

c)

- 3. How many outcomes are possible with Bernoulli trial?
 - a) 2
 - b) 3
 - c) 4
 - d) None of the mentioned

2)

FLIP ROBO

- 4. If Ho is true and we reject it is called
 - a) Type-I error
 - b) Type-II error
 - c) Standard error
 - d) Sampling error

a)

- 5. Level of significance is also called:
 - a) Power of the test
 - b) Size of the test
 - c) Level of confidence
 - d) Confidence coefficient

b)

- 6. The chance of rejecting a true hypothesis decreases when sample size is:
 - a) Decrease
 - b) Increase
 - c) Both of them
 - d) None

b)

- 7. Which of the following testing is concerned with making decisions using data?
 - a) Probability
 - b) Hypothesis
 - c) Causal
 - d) None of the mentioned
 - b)
- 8. What is the purpose of multiple testing in statistical inference?
 - a) Minimize errors
 - b) Minimize false positives
 - c) Minimize false negatives
 - d) All of the mentioned

d)

- Normalized data are centred at_and have units equal to standard deviations of the original data
 - a) 0
 - b) 5
 - c) 1
 - d) 10

a)

Q10and Q15 are subjective answer type questions, Answer them in your own words briefly.

10. What Is Bayes' Theorem?

Bayes' theorem describes the probability of occurrence of an event related to any condition. It is also considered for the case of conditional probability. Bayes theorem is also known as the formula for the probability of "causes". For example: if we have to calculate the probability of taking a blue ball from the second bag out of three different bags of balls, where each bag contains three different colour balls viz. red, blue, black. In this case, the probability of occurrence of an event is calculated depending on other conditions is known as conditional probability.

11. What is z-score?

A z score is simply defined as the number of standard deviation from the mean. The z-score can be calculated by subtracting mean by test value and dividing it by standard value. Where x is the test value, μ is the mean and σ is the standard value.

12. What is t-test?

The t-test is a test that is mainly used to compare the mean of two groups of samples. It is meant for evaluating whether the means of the two sets of data are statistically significantly different from each other.

13. What is percentile?

A percentile is a comparison score between a particular score and the scores of the rest of a group. It shows the percentage of scores that a particular score surpassed.

14. What is ANOVA?

Analysis of variance (ANOVA) is a collection of statistical models and their associated estimation procedures (such as the "variation" among and between groups) used to analyze the differences among means.

15. How can ANOVA help?

ANOVA is helpful for testing three or more variables. It is similar to multiple two-sample t-tests. However, it results in fewer type I errors and is appropriate for a range of issues. ANOVA groups differences by comparing the means of each group and includes spreading out the variance into diverse sources.
